No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                 Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes a human ROC2 ring finger protein. The specification also describes human ROC1. ROC1 and ROC2 are similar to APC11, a subunit of the APC complex. The proteins stimulate cullin dependent ubiquitin ligase activity. ROC1 functions in vivo as an essential regulator of CDK inhibitor Sic1 degradation by the SCF (undefined) pathway. ROC proteins are useful for screening bioactive agents that interfere with the binding of ROC proteins with cullin proteins. Pharmaceutical formulations comprising ROC proteins are useful for diagnostic and therapeutic purposes, preferably for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cubiquitin conjugating enzyme) and E3 (ubiquitin ligase) and measuring the amount of tag1-ubiquitin bound to the E3. The method is useful for assaying ubiquitin ligase activity and ubiquitination enzyme activity condition is useful for identifying ubiquitination modulator. The method comprises combining tag1-ubiquitin, the modulator, E1 E2 and tag2-E3 cand measuring the amount of tag1-ubiquitin bound to tag3-E2 or combining c2 tag1-ubiquitin modulator, E1 and tag3-E2 and measuring the amount of c3-E2. Ubiquitin ligase activity is measured c3 cdirectly, eliminating the need from unligated measuring the amount of c3-E3. Ubiquitin ligated activity is measured c3 cdirectly, eliminating the need from unligated material in an c5 chalysis such as separating ligated from unligated material in an c5 chroughput screening techniques for modulators of ubiquitination c2 combinations of E3 components and E2/E3 combinations without requiring c1 prior identification of specific target substrates. Ubiquitin is labeled, c3 cdirectly or indirectly and this allows for easy and rapid detection and c3 cmeasurement of ligated ubicmitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an assay for ubiquitin ligase (UL) activity which comprises incubating tag1-ubiquitin, El (ubiquitin-activating enzyme), E2 (ubiquitin-conjugating enzyme/ubiquitin carrier protein) and E3 (UL) and measuring the amount of tag1-ubiquitin bound to E3. The method is particularly used to screen for modulators of UL activity. The present sequence is human RING finger protein, ROC2 DNA.
                                                                                                                                                                                                           SAG gene; sensitive to apoptosis; human; cancer; tumour; neurodegenerative disease; muscular dystrophy; wound healing; vulnerary; therapy; mutant; ds.

These properties were unaffected by the MM9 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM9, which codes for a SAG protein (see AAY06503) in which the Cys residue at position 99 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 99 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is in zinc-ring finger 2 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in hem binding and SAG

                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM14, which codes for a SAG protein (see AAY06508) in which the Cys residues at positions 99 and 102 of the native protein (see AAY06492) are replaced by Ser residues owing to mutations of codons 99 and 102 through site-directed mutagenesis of SAG cDNA. These residues are in zinc ring finger 2 of SAG. Single double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization was observed, indicating that these residues are important for intermolecular disulfide bond formation. SAG is a novel zinc finger protein that promotes cell growth, protects can be used to protect cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of the strength beginning the service of the strength beginning the service and muscle strength of the service and success and muscle strength.

                                                                                                                                            oligomerization. These properties were unaffected by the MM15 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                             This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MMIS, which codes for a SAG protein (see AAY0650; in which the Cys residue at position 47 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codor 47 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is in a GADPH binding, site of SAG. Single and double SAG mutants (see AAX87317-31) were made to determine to the of each cysteine residue of SAG in haem binding and SAG comparation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sun

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     á
                                                                                                             This is the nucleotide sequence of human sensitive to apoptosis (SAG) cDNA, which codes for a novel redox sensitive, haem-binding protein (see AAY06492) with a zinc RING finger domain that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. The cDNA was isolated from a HeLa cell cDNA library using mouse SAG cDNA (see AAX87313) as probe. SAG is highly conserved among species. Disruption in yeast was shown to be lethal. SAG deletion mutants (see AAX87315-16) have been identified in human cancer lines, suggesting a role in carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. Antisense SAG genes can be used to inhibit the growth of the sAG genes can also be used for the recombinant production of the SAG genes can also be used for the recombinant concerns the same of the sAG proteins. The SAG proteins can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular target in the development of during against neurodegenerative disorders, cancers and muscle

New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions used as food additives or preservatives or preservatives and

Claim 1; SEQ ID No 39; 980pp; English.

The invention relates to isolated nucleic acid molecules and their CC encoded secreted proteins. The nucleic acids and proteins are used to CC prevent, treat or ameliorate a medical condition in e.g. humans, mice, CC rabbits, goats, horses, cats, dogs, chickens or sheep. They CC are also used in diagnosing a pathological condition or susceptibility CC to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in CC diagnostic immunoassays e.g. radioimmunoassays or enzyme linked CC immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, CC cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders (e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. CC Alzheimer's disease, infections caused by bacteria, viruses and fungii CC and ocular disorders e.g. corneal infection, and many other CC disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to CC transplantation, for supporting cell culture of primary tissues, to CC expabilities, fat content, lipid, protein, carbohydrate, vitamins, capabilities, fat content, lipid, protein, carbohydrate, vitamins, capabilities, fat content, lipid, protein, carbohydrate, vitamins, capabilities, fat content, lipid, protein, carbohydrate, vitamins minerals, cofactors and other nutritional components. The present encodes a novel secreted protein components. of the inve invention.

diagnosing, preventing, treating or ameused as food additives or preservatives New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and

Claim ۲. SEQ ID No 498; 980pp; English.

CC encoded secreted proteins. The nucleic acids and proteins are used to compressed to react, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They can also used in diagnosing a pathological condition or susceptibility care also used in diagnosing a pathological condition or susceptibility compared to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in care diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. replasms of the breast or liver, compared to the disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection, and many other compared to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used cas a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, contents encodes a novel secreted protein of the invention. minerals, cu-monce encodes The invention relates to isolated nucleic acid molecules and their

                                                                                                                                 Ś
                                                                                                                                                                                                                                                  The invention relates to human novel polypeptides and their associated C polynucleotides. The polypeptides and polynucleotides are useful in gene CC therapy for treating, inhibiting or preventing neural disorders, immune CC system disorders (e.g. systemic lupus erythematosus, rheumatoid C arthritis and multiple sclerosis), muscular disorders, respiratory CC diseases (e.g. nasal vestibulitis, nasal polyps and sinusitis), CC reproductive disorders, gastrointestinal disorders, pulmonary disorders, CC cardiovascular disorders (e.g. congenital heart defects, Ebstein's CC anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hypoproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. CC (e.g. Hodgkin's disease and appendicitis), allergic reactions and CC conditions (e.g. asthma), blood related disorders (e.g. thrombosis, conditions (e.g. asthma) and cancerous diseases. CC sequences ABX73173-ABX74167 represent human novel polynucleotides of the

which represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipacviatic; antiparkinsonian; nootropic; neuroprotective; CC osteopathic; anticonvulsant; antiarthritic; immunosuppressant; CC immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; CC antidiabetic; apportantion; The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating CC pathological conditions associated with an ORFX-associated disorder. The mucleic acids can be used to express ORFX proteins in gene therapy concises. The proteins and nucleic acids may be used to treat cancers, CC proliferative disorders, neurodegenerative disorders, osteoarthritis, CC staff vs host disease, cardiovascular disease, diabetes mellitus, typertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allegic and present anticon autoimune disorders, aschma, collesterial autoimune disorders, aschma, allegic allegic and present autoimune disorders, aschma, allegic allegic and present autoimune disorders, aschma, allegic allegic and present autoimune disorders.

                                                                                                      (SAG) mutant gene MMB, which codes for a SAG protein (see AAY06502)

(In which the Cys residue at position 88 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 88 from TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 2 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MMB mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.

This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM1, which codes for a SAG protein (see AAY06495) in which the Cys residue at position 50 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is at a haem binding site of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. MM1 showed reduced haem binding but unaffected oligomerization. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                   Sun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens.

                   This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM7, which codes for a SAG protein (see AAY06501) in which the His residue at position 85 of the native protein (see AAY06492) is replaced by a Lys residue owing to a mutation of codon 85 from CAC to AAG obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 2 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM7 mutation. SAG is a novel zinc finger protein that promotes

They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                    SAG: Sensitive to Apoptosis Gene and promoting cell growth and protecting

```

This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM2, which codes for a SAG protein (see AAY06496) in which the Cys residue at position 53 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is at a haem binding site of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine

determine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligomerization. These properties were unaffected by the NM2 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM3, which codes for a SAG protein (see AAY06497) in which the Cys residues at positions 50 and 53 of the native protein (see AAY06492) are replaced by Ser residues owing to mutations of codons 50 and 53 form TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. These residues are at a haem binding site of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. MM3 showed greatly reduced haem binding and SAG oligomerization. MM3 showed greatly reduced haem binding and SAG oligomerization. MM3 showed greatly reduced haem binding and sAG oligomerization was unaffected. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of dyntrophy. and promoting wanted healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches 107;

                                                                                                                                                                                                                                                                                                                                              Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human sensitive to apoptosis (SAG) gene mutant MM10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligomerization. These properties were unaffected by the MM6 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM6, which codes for a SAG protein (see AAY06500) in which the His residue at position 82 of the native protein (see AAY06492) is replaced by a Lys residue owing to a mutation of codon 82 from CAT to AAA obtained by site-directed mutagenesis of SAG CDNA. This residue is in zinc ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG mutants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27-SEP-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM10, which codes for a SAG protein (see AAY06494) CI in which the His residues at positions 82 and 85 of the native protein (see AAY06492) are replaced by Lys residues owing to protein (see AAY06492) are replaced by Lys residues owing to CINA. These residues are in zinc-ring fingers 1 and 2 of SAG SAG mutants (see AAX97317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and oligomerization. These properties were unaffected by the MM10 mutations. SAG is a covel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the creversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of C dargs against neurodegenerative disorders, cancers and muscle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM5, which codes for a SAG protein (see AAY06499) in which the Cys residue at position 80 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 80 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is in zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG colors and sag and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in haem binding and SAG colors are the role of each cysteine residue of SAG in ham benefit and the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG colors are the role of each cysteine residue of sAG col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligomerization. These properties were unaffected by the MMS mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets
                                                                                                                                                                                     SAG gene; sensitive to apoptosis; human; cancer; tumour; neurodegenerative disease; muscular dystrophy; wound hea volnerary: therapy; mutant; colon carcinoma; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in SAG RNA, but not in genomic DNA. It suggests a possible role for SAG in human carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells from apportosis induced by redox reagents. Antisense SAG genes can be used to inhibit the growth of tumour cells. The SAG genes can also be used for the recombinant production of the SAG proteins. The SAG proteins can be used to scavenge oxygen radicals in organisms and to promote wound healing. Additionally, the SAG genes or their complements can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular target in the development of the SAG genes or their complements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human sensitive to apoptosis gene SAG (see also AAX87314). The cDN was obtained by PCR amplification of RNA isolated from DLD-1 colon carcinoma cells (ATCC CCL 221). It contains a 7 bp deletion compared with native SAG, starting at nucleotide 170 of the coding region that codes for a potential haem binding site. The frame shift deletion abolishes the downstream zinc finger in the resulting protein (see AAY66493). The mutation was detected by PCR resulting protein (see AAY66493).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAG: Sensitive to Apoptosis Gene and related proteins, useful for promoting cell growth and protecting cells against apoptosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of human apoptosis associated (SAG) protein 12. These sequences can be used in the diagnosis and treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various types of inflammation. The present sequence is the SAG protein 12 coding sequence.

These properties were unaffected by the MM4 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                      Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM4, which codes for a SAG protein (see AAY06498) in which the Cys residue at position 61 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is at zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteeine residue of SAG in them banding and SAG colors.

Cin which the Cys residue at position 73 of the native protein (see AAV06492) is replaced by a Ser residue owing to a mutation of codon 73 from TGT to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is in a protease inhibitor movif of SAG. Single and double SAG mutants (see AAX87317-31) were made to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM12 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (SAG) mutant gene MM11, which codes for a SAG protein (see AAY06505)

(in which the Cys residue at position 64 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 64 from TGT to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG mutantion. These properties were unaffected by the MM11 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM13, which codes for a SAG protein (see AAY06507) in which the Cys residues at positions 61 and 64 of the native protein (see AAY06422) are replaced by Ser residues owing to mutations of codons 61 and 64 through site-directed mutagenesis of SAG cDNA. These residues are in zinc ring finger 1 of SAG. Single Couble SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. MM13 showed greatly reduced haem binding (and a cereased brown colour) but oligomerization was unaffected. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle

The proteins given represent the cc signal peptide and an N-terminal fragment of a secreted protein. The cc nucleic acid sequences can be used for producing secreted human gene cc products. They can also be used to develop products for diagnosis and cc therapy. The proteins obtained may have cytokine activity, cell cc proliferation/differentiation activity, haematopoiesis regulating cc activity, tissue growth regulating activity, reproductive hormone cr regulating activity, chemotactic/chemokinetic activity, haematory cativity, the products can decrease the used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into

                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                  human sensitive to apoptosis gene SAG (see also AAX87314). The CDNA was obtained by PCR amplification of RNA isolated from DLD-1 colon carcinoma cells (ATCC CCL 221). It contains a 48 bp deletion compared with native SAG, starting at nucleotide 177 of the coding region that codes for a potential haem binding site. The in-frame deletion eliminates 16 amino acids in the encoded protein (see AAY06494) but retains the zinc finger motif. The mutation was detected by PCR in SAG RNA, but not in genomic DNA. It suggests a possible role for SAG in human carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. Antisense SAG genes can also be used for the recombinant production of the SAG genes can also be used for the recombinant production of the SAG genes or their complements can be used to scavenge oxygen radicals in organisms and to proteins can be used to proteins or the SAG genes or their complements can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular carget in the development of drugs against neurodegenerative
                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                         Query Match

antipsoriatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; cosqulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The mucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, thypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allowed the combined immunodeficiency (SCID) as thems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antianaemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; altergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation;

                                                                                                                              밁
                           Ş
                                                                                                                                                                        set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minicular biological or pathological state, and so allowing the condition of tissue- and pathological state, and so allowing the condition; to detect developmental specific genes such as those genes condition; to detect developmental specific genes and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent othe exemplification of the present invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a

(ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthitits, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet or coagulation disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; genome mapping; gene therapy; food supplement; virus; cell-proliferative disease; bacte: cell-proliferative disease; bacte: Parkinson's disease; Albeimer's disease; autoimmune disease; multiple sclerosis; diabetes; genetic disorder; wound; burn;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABZ11414;
                                                                                                               Sequence
                                                                                                                                                                     Note: The sequence data for this patent did not specification, but was obtained in electronic fo at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          05-MAR-2001; 2001US-0799451.

                                                                                              This is the nucleotide sequence of mouse sensitive to apoptosis (SAG) cDNA, which codes for a novel redox sensitive, haem-binding protein (see AAY06491) with a zinc RING finger domain that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. The cDNA was isolated using differential display to identify genes associated with 1,10-phenanthroline (OP)-induced apoptosis in murine tumour lines, and use of an isolated OP-inducible clone to screen a mouse lung cDNA library. The mouse SAG cDNA was used to identify human SAG (see AAX87314). SAG is highly conserved among species. Disruption in yeast was shown to be lethal. SAG deletion mutants (see AAX87315-16) have been identified in human cancer lines, suggesting a role in carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells. The SAG genes can be used to inhibit the growth of the SAG genes san also be used for the recombinant production of the SAG genes can also be used for the recombinant of the SAG genes can also be used for the recombinant of the SAG genes can also be used for the recombinant the sadditionally, the SAG genes or their complements can be used to protein is also an ideal molecular target in the development of drugs against neurodegenerative disorders, cancers and muscle
